Genus GALGULA Guenée, 1852
NOTE: Prior molecular phylogenetic work placed *Galgula* and *Spodoptera* as sister to *Elaphria* (Mitchell et al. 2000), with *Galgula* subsequently placed in the Elaphriini (Fibiger & Lafontaine 2005). Phylogenetic analysis with more representative noctuid lineages and additional molecular markers strongly support a close relationship of *Galgula* and *Spodoptera* to the exclusion of *Elaphria* and other Elaphriini genera (Keegan et al. 2021), lending support to previous classification of both in the Prodeniini, and that is followed herein.

Tribe CARADRININI Boisduval, 1840

Subtribe CARADRININA Boisduval, 1840

Genus CARADRINA Ochsenheimer, 1816
ID INFO (partial): Hacker (2004), Mustelin (2006).
NOTE: Although NA species formerly placed in *Protoperigea* were not included in Hacker's (2004) revision of the Caradrinini, morphological study of these species by Jan Metlevski (pers. comm.) indicates that they should be subsumed within the broader current concept of *Caradrina* proposed by Hacker. Indeed, DNA barcode variation not only corroborates placement within the genus, it suggests the native NA species form a small species radiation with a single origin derived from this very diverse Eurasian genus. The following new combinations are therefore proposed: *Caradrina* (= *Protoperigea* n. syn.), *Caradrina anotha* (n. comb.), *C. posticata* (n. comb.), *C. umbricata* (n. comb.), *C. subterminata* (n. comb.), *C. parvulata* (n. comb.), *C. calientensis* (n. comb.). Although Hacker (2004) proposed a number of subgenera within *Caradrina*, we do not assign those formerly in *Protoperigea* to any subgenus, pending a full comparison to Eurasian genus-group taxa.

lepida Lintner, 1878 (Lithophane)
ssp. b. adipel (Benjamin, 1936) (Graptolitha) N. STAT.
NOTE: The taxon *adipel* was treated as a subspecies of *lepida* in a revision of the *Lithophane lepida* group by Troubridge & Lafontaine (2003). In Lafontaine & Schmidt (2010) *adipel* was raised to species without further comment. The two taxa, both based on eastern NA type specimens, represent slightly different adult phenotypes that differ in geographic range and possibly larval hostplant, as detailed in Schweitzer et al. (2011) and Wagner et al. (2011). The information presented in the latter two references, in addition to novel DNA barcode data (BCS unpublished data), do not provide compelling evidence that *lepida* and *adipel* represent separate species, and *adipel* is accordingly returned to subspecies status here.

93 2583.1 P. moffatiana (Grote, 1882) (Scopelosoma) REV. STAT. [NEW]
NOTE: A previously unrecognized species of *Pyreferra*, the biology of which is discussed by Wagner et al. (2011), has been included within the concept of *P. citrombra*. Examination of the type specimens of *Pyreferra* junior synonyms reveals that the name *moffatiana* applies to this taxon, and is here raised to species status (rev. stat.). *Pyreferra moffatiana* is externally intermediate between *P. hesperidago* and *P. citrombra*, being larger than *P. citrombra* but with more curved forewing lines; compared to *P. hesperidago* it is paler overall with a less sinuate medial line. Based on DNA barcodes, the nearest relative is *P. citrombra* which differs by about 3%.

NOTE: All NA reports of *A. helvola*, generally as "*Nephelodes emmedonia pectinata* Smith, 1888", are erroneous. (*Phalaena emmedonia* is now a synonym of *A. helvola*). In NA, these records refer to *A. lota* in NL, and to *Nephelodes minians* (Noctuinae: Tholerini) elsewhere on the continent.

93 2615.2 A. lunosa (Haworth, 1809) (Noctua) I [NEW]
NOTE: This European species was introduced to USA, and first detected in the Washington, DC area in 2013. As of this writing, iNaturalist records indicate it is now also present in adjacent parts of VA and MD. This species was reported as *Omphaloscelis lunosa* in Schmidt & Lafontaine (2018), but that genus was synonymized by Fibiger et al. (2010).

93 2617 S. decipiens (Grote, 1881) (Orthosia) 9958
NOTE: The western NA species is currently known as *S. decipiens*, but that name may not be correct. Franclemont (in Forbes 1954) treated *decipiens* as a form of *S. bicolorago* and returned *acta* to full species, which may be the correct arrangement. The type locality of *decipiens* was purportedly IL, but the type specimen appears to be lost so a neotype is needed to resolve this issue. Franclemont & Todd (in Hodges et al. 1983) subsequently treated *decipiens* as a full species with *acta* as a synonym but without explanation. Herein we retain the latter interpretation pending taxonomic work.

aequilinea (Smith, 1883) (Calymnia)
intexta Harvey, 1875 (Ipimorpha) N. SYN.
NOTE: This name was inadvertently omitted in most NA checklists, but included as a valid species by Poole (1989). The type, purported to be in the NHMUK by Poole, was not located during a search of all Nearctic Noctuidae types in the NHMUK in 2007 (Don Lafontaine, pers. comm.). Since only a single species of the distinct genus *Ipimorpha* occurs in eastern North America, and since Harvey described *intexta* as being slightly darker and more slender than *I. pleonectusa*, with both taxa from exactly the same TL (Sharon Springs, NY), *intexta* is here placed in synonymy under *I. pleonectusa* (n. syn.).

932962 L. humidicola Guenée, 1852 (Leucania) 10458
solita Walker, 1856 (Leucania) N. SYN.
NOTE: Although not formally raised from synonymy under *L. humidicola*, *solita* was treated as a distinct species by Troubridge (2020). Samples from Venezuela representing nominate South American *humidicola* show 1.8% DNA barcode divergence from Central American and NA *solita* (TL: Honduras), but there are no conclusive differences in genitalic structure between the two groups (Don Lafontaine, pers. comm.), whereas closely related *Leucania* otherwise show obvious genitalic differences. We therefore return *solita* to synonymy under *L. humidicola* (n. syn.) pending further taxonomic study.

932967.3E I. mutans (Walker, 1857) (Hadena) EXCL. [NEW]
passa (Morrison, 1875) (Mamestra) (excl.)
NOTE: The synonym *Mamestra passa* was described from "California"; however, Franclemont (1981) determined that the type is a mislabeled specimen of the New Zealand endemic *I. mutans* (treated as "*Graphania mutans*" therein). Placement of the genus and species entry here at the end of the Leucaniini is tentative, following the assertion by Hoare (2019) of a "plausible suggestion of a close relationship with Leucaniini" for *Ichneutica*, as part of the *Physetica* genus group Hoare, 2017.

NOTE: This taxon was described from Hoboken, NJ. The type has been lost, and the name was inadvertently omitted from recent NA checklists, including Franclemont & Todd (in Hodges et al. 1983), Lafontaine & Schmidt (2010), and Pohl et al. (2016). Based on the description, it is most likely a synonym of *L. olivacea*, and it is hereby placed there (n. syn.). That conclusion can be reassessed if the type ever materializes.

NOTE: The first NA (TX) record of this species was reported in the 2004 Season Summary of the Lepidopterists' Society (2005), based on a specimen collected in 1988 by Ed Knudson. It was not listed by Lafontaine & Schmidt (2010), because *scribillata* was described as an aberration and is therefore unavailable. This taxon does not have a valid name, but appears to be a valid biological species.

Genus TRICHOPOLIA Grote, 1883
ID INFO: Lafontaine et al. (2014).

NOTE: *Trichopolia dentatella*, the type species of *Trichopolia*, is very similar in antennal and genitalic morphology and wing phenotype to *Protorthodes antennata* (Jan Metlevski, pers. comm.), and DNA barcode variation confirms a close relationship between these two taxa and the remainder of *Protorthodes*, including the type species *Protorthodes curtica*. Similarly, *Trichopolia suspicionis* is most closely related to *Protorthodes alfkeni*. When McDunnough (1943) described *Protorthodes*, he made no mention of *Trichopolia*, apparently an oversight on his part. The type species of the two genera are here treated as congeners, rendering *Protorthodes* a junior subjective synonym of *Trichopolia* (n. syn.) and resulting in the following new combinations: *Trichopolia curtica* (n. comb.), *T. eureka* (n. comb.), *T. incincta* (n. comb.), *T. argentoppida* (n. comb.), *T. mulina* (n. comb.), *T. oviduca* (n. comb.), *T. orobia* (n. comb.), *T. melanopis* (n. comb.), *T. texicana* (n. comb.), *T. perforata* (n. comb.), *T. rufula* (n. comb.), *T. ustulata* (n. comb.), *T. alfkenii* (n. comb.), *T. antennata* (n. comb.).

NOTE: This species was reported from TX by Lafontaine & Schmidt (2010). They state that it was reported from TX by Blanchard (1973a) but it was not mentioned in that paper. It does not belong in *Hyssia*, but was provisionally placed there by Lafontaine & Schmidt (2010).

Genus "ERIOPYGA" Guenée, 1852 PROV. PL.
NOTE: The species *E. crista* and the undescribed species near *crista* were provisionally placed in *Eriopyga* by Lafontaine & Schmidt (2010).

9303162 E. crista of authors; (not Walker, 1856) (Mamestra) MISAPPL.; mispl. [NEW]
NOTE: This undescribed species has been misidentified as *E. crista*, an extralimital species which has been reported from NA in error, see note under the "true" "*Eriopyga" crista*.
9303162.1E E. crista (Walker, 1856) (Mamestra) EXCL.; mispl. 10605
NOTE: *Eriopyga crista* has been listed from NA based on the synonym *dissimilis*, which was described based on a mislabeled specimen from "AZ". "True" "*Eriopyga*" *crista* is restricted to Central America and southern Mexico. However, other records from AZ refer to an undescribed species of "*Eriopyga*" from that area (Lafontaine & Schmidt 2010), see note under that undescribed species.

Tribe NOCTUINI Latreille, 1809

Subtribe AGROTINA Rambur, 1848

ID INFO: Lafontaine (1987, 2004).

AUSTRANDESIA GROUP OF GENERA Schmidt, 2023

NOTE: This group of genera was treated as the subtribe Austrandesiina Angulo & Olivares, 1990 by Lafontaine (2004). With a subsequent broader definition of the Noctuinae that resulted in former Noctuinae tribes down-ranked to subtribes, former subtribes were no longer recognized (e.g., Lafontaine & Schmidt 2010), as there is no formally recognized family-group rank below subtribe. In order to maintain the systematic information conveyed by the Austrandesiina in the sense of Lafontaine (2004), that taxon is here defined as the *Austrandesia* group.

APPENDIX I
Lengthy taxonomic notes

1. Lasiocampidae. GENUS PHYLLODESMA Hübner, 1820

This genus was revised by Lajonquière (1968) and again by Franclemont (1973a). The main differences proposed by Franclemont (1973a) were that Lajonquière's many subspecies of *P. americana* were revised to synonymy, and that three rather than two NA species were recognized (*P. americana*, *P. carpinifolia*, *P. coturnix*). Lajonquière (1968) recognized 12 subspecies of *P. americana*, whereas Franclemont (1973a) recognized none but then reverted to recognizing six subspecies in the 1983 checklist (Franclemont, in: Hodges et al. 1983). Another contentious point concerned which populations the name *carpinifolia* pertained to. Lajonquière (1976) published an addendum to his 1968 revision emphasizing that *carpinifolia* applied to CA populations, as he had originally interpreted it (Lajonquière 1968). Franclemont (1973a), however, stated that *carpinifolia* pertained to a southeastern USA taxon (type locality: GA). It is therefore unsettled as to what the name *carpinifolia* applies to; Franclemont (in Hodges et al. 1983) maintained his interpretation of a southeastern, not west coast, taxon.

The separation of the three purported species as diagnosed by Franclemont (1973a) has always been problematic because they are distinguished based primarily on geographic location and wing phenotype differences rather than discrete structural differences. Franclemont argued that the shape of the male valve differed slightly between species, but variation in genital structure among all NA populations is extremely slight and of questionable utility as diagnostic interspecific characters.

Since the work of Franclemont (1973a) and Lajonquière (1968, 1976), molecular data and much additional study material has become available. Neither molecular nor ecological data unequivocally support the existence of more than a single species in NA. Variation of DNA barcodes is relatively large but is not concordant with previous species concepts nor entirely concordant with major biogeographic boundaries. For example, CA *P. coturnix* DNA lineages occur together with *P. americana* lineages in southwestern BC, and there is no corroborating evidence that these are phenotypically or ecologically distinct species occurring together. Similarly, southeastern USA *occidentis* populations exhibit two DNA lineages that co-occur with a third lineage throughout eastern NA. Franclemont (1973a) argued that *occidentis* was a species distinct from *P. americana* because it was a more southern univoltine species, whereas *americana* is bivoltine throughout most of the Northeast; in the light of other evidence, it is equally plausible that a single, widespread species is facultatively bivoltine only where climatic conditions are favorable. Lastly, the NA DNA lineages are interdigitated with Eurasian *P. ilicifolia* (Linnaeus, 1758) / *P. japonica* Leech, 1888) / *P. tremulifolia* (Hübner, [1810]), indicating a very close and possibly conspecific relationship with Eurasian taxa. In summary, the last two taxonomic revisions of NA *Phyllodesma* differ substantially in taxonomic concepts; it is not currently possible to reliably identify the three recognized species; and there is no convincing evidence that more than one species is present in NA. Consequently, all NA populations are here treated as a single, variable species.

2. Family Saturniidae

2a. Hemileuca maia group Tuskes et al., 1996

This group is perhaps the single most contentious area of NA Bombycoidea systematics, due to the complex phenotypic, genetic, and biogeographic systems underpinning these moths (see for example, recent work in Rubinoff et al. 2017; Dupuis et al. 2018; Pavulaan 2020; Tuttle et al. 2020, 2021) Application of standard Linnaean taxonomy does not reasonably address the intricacies of admixture, secondary contact, and rapid ecological specialization that are rampant in this group. The weak to nonexistent morphological and genetic differences between certain named taxa, for example, do not parallel well-defined ecological specializations that are observed and diagnosable. This has led to significant uncertainty in naming the various identifiable populations. For the purposes of this checklist, the more liberal breakdown of genetic clusters in this *Hemileuca* complex is followed, as shown in Dupuis et al. (2018, fig. 2), recognizing *H. maia*, *H. menyanthevora*, n. stat., and *H. nevadensis*, as well as the biogeographically, morphologically, and/or ecologically distinct populations within the broader concept of *H. maia* (e.g., *H. slosseri*, *H. peigleri*, and *H. lucina*). Additionally, to be consistent, other less recognizable populations with previously little evidence in the literature for their distinction (*H. orleans* n. stat., *H. sandra* n. stat., and *H. warreni* n. stat.), must also be

treated as valid. The taxon *H. iroquois*, described as a "hemispecies" in Cryan & Dirig (2020), refers to the same entity as *H. menyanthevora* (described as a subspecies); *iroquos* is here synonymized with the senior name *menyanthevora* and the latter name raised to full species status. Further taxonomic work must be carried out to determine whether a simpler classification (whereby many *H. maia* complex names will be sunk) or a more diverse classification (whereby many populations of the *H. maia* complex will require new names) is the more reasonable choice to properly encompass the ecological, morphological, and genetic diversity of the moths in this group.

2b. 890052 Hemileuca eglanterina (Boisduval, 1852)

Hemileuca vanschaycki is hereby synonymized with *H. eglanterina* (n. syn.). The extreme variability and wide geographic distribution of *H. eglanterina*, coupled with the lack of any external diagnostic characters differentiating *H. vanschaycki* from *H. eglanterina* and only tenuous genitalia character differences (seemingly due to genitalia preparation methods), results in *H. vanschaycki* being an unsubstantiated taxon. Apparently, this name was applied merely based on DNA barcoding results, though pertinent information such as percent genetic distance between *H. vanschaycki* and *H. eglanterina*, a phylogenetic reconstruction showing how *H. vanschaycki* fits into the evolutionary framework of *H. eglanterina* (and its various subspecies), and detailed morphological comparisons are all wanting. Undoubtedly the *H. eglanterina* complex is not fully understood from a taxonomic perspective, and there is the potential for cryptic diversity to be recognized. However, haphazard application of names such as *H. vanschaycki* onto a single specimen (the two "paratypes" of *H. vanschaycki* were apparently not examined by the authors as these are only referenced by BOLD voucher numbers with no associated collecting data) is problematic and not warranted at this time.

3. Family Sphingidae

3a. 890111 Sphinx chersis (Hübner, [1823])

The taxa *oreodaphne* and *pallescens* were reinstated as subspecies by Kitching & Rougerie et al. (2018); their rationale is as follows. Rothschild & Jordan (1903) recognized four subspecies within *Sphinx chersis*: ssp. *chersis* (eastern Canada and northeastern USA); ssp. *pallescens* (CO, AZ); ssp. *oreodaphne* (CA, OR) and ssp. *mexicanus* (Rothschild & Jordan, 1903) (Mexico, with no further resolution). They noted that there were no differences among the subspecies in the male genital morphology and that the habitus differences were "slight". Hodges (1971: 83) recognized no subspecies within *Sphinx chersis* (although he did not refer to ssp. *mexicanus*) and that remained the situation until they were reinstated by Kitching & Rougerie et al. (2018), which is maintained in the present checklist. Although acknowledging that apparent morphological differences are minimal, analysis of DNA barcodes has revealed rather large divergences between three of the putative subspecies: *chersis*/*mexicanus*, ~3%; *chersis*/*pallescens*, ~4%; *mexicanus*/*pallescens*, 2.0 to 2.3% (no samples of *oreodaphne* were available). In addition, the distribution pattern of the four subspecies is very similar to that of the four taxa of the *Smerinthus cerisyi* species-group (see Appendix section 3d below), and formal recognition of the *Sphinx chersis* subspecies will facilitate future biogeographical studies. There is also a similar unresolved taxonomic issue in that it is still unclear as to which Mexican subspecies of *chersis* the name *mexicanus* properly applies. In the original description, Rothschild & Jordan (1903) gave the type locality only as "Mexico". The matter will only be resolved when the holotype has its DNA sequenced.

3b. 890119.1 Sphinx oslari (Rothschild & Jordan, 1903)

This species was revalidated by Kitching & Rougerie et al. (2018); their rationale is as follows. Rothschild & Jordan (1903) described *Hyloicus gordius oslari*, based on three males and two females from Glenwood Springs, CO. This isolated population was stated to differ from the nominotypical subspecies in being larger and paler (especially the forewing) and, on the underside, a less sharply marked hindwing medial band and very small abdominal spots. It was synonymized with nominotypical *S. gordius* by Hodges (1971), who, while admitting the generally larger size of *oslari*, considered that this might not be overly significant and that the other diagnostic features all fell within the range of individual variation of *S. gordius*. *Sphinx gordius oslari* was reinstated as a subspecies by Kitching & Cadiou (2000), who considered that the differences in size and pattern, together with the highly disjunct distribution, warranted recognition as a subspecies. Tuttle (2007:

86) only noted the taxon in passing ("Interestingly, there are isolated populations [of *S. gordius*] in Colorado and Utah"). Most recently, Kitching & Rougerie et al. (2018) treated *S. oslari* as a species. A study of the series in the NHMUK has confirmed Hodges' (1971) suspicions regarding the difference in size between the two taxa: *S. gordius*, forewing length = 30 to 39 mm, n = 51 males; *S. oslari*, forewing length 35 to 44 mm, n = 16 males. Similar size differences were also noted in cursory examination of the *S. gordius* and *S. oslari* material in the MGCL. There are also differences in the male genitalia. The gnathos of *S. gordius* is bluntly pointed but rounded in *S. oslari*. The upper lobe of the harpe in *S. oslari* is broader and bears small spines along its entire length ventrally as well as apically; in *S. gordius*, these spines are restricted to a small number at the very apex (the specimen illustrated by Hodges (1971: figure 7) appears to be that of an *S. oslari* but this cannot be confirmed as no provenance was given). Finally, the sharply pointed apical process of the phallus is shorter and broader in *S. oslari* than in *S. gordius*, reaching only as far as the diverticula of the everted vesica, rather than well beyond.

3c. 890125 Sphinx sequoiae: syn. engelhardti Clark, 1919

Kitching & Rougerie et al. (2018) returned *engelhardti* to synonymy with *S. sequoiae*; their rationale is as follows. *Sphinx dolli [sic] engelhardti* was described by Clark (1919) from three males and a female collected at Bellevue, Washington Co., UT. Shortly afterwards, on the advice of Karl Jordan, Clark (1920) synonymized it with *S. sequoiae*. Hodges (1971: 70) accepted this assignment to species but rejected a subspecific separation. Tuttle (2007: 92) noted that "the type locality for *engelhardti* is beyond the range of any subsequent *sequoiae* collections but well within the range of *S. dollii*" and on this basis alone, re-synonymized *engelhardti* with *S. dollii*. However, examination of the genitalia of a male from St. George, Washington Co., UT, in the NHMUK, showed that the harpe has the shape of *S. sequoiae*, in which the marginal teeth project distally, rather than that of *S. dollii*, in which they are recurved (as illustrated by Hodges 1971: 71). On this basis, Kitching & Rougerie et al. (2018) returned *engelhardti* to synonymy with *S. sequoiae* and this status is maintained in the present checklist. Nevertheless, given its disjunct distribution, *engelhardti* clearly requires further study to fully ascertain its taxonomic status.

3d. 890141.1 Smerinthus astarte Strecker, [1885]

This taxon was reinstated as a valid species by Kitching & Rougerie et al. (2018); their rationale is as follows. Hodges (1971: 83) noted that "the name *astarte* has been applied to specimens [of *Smerinthus cerisyi*] in which the black mark in the center of the blue area extends to the surrounding black margin and is somewhat diamond shaped" and treated it as a form of *Smerinthus cerisyi*. Based on characters of the male genitalia, he then reinstated *Smerinthus saliceti* as a species for the populations in southern CA and southern AZ, noting also that "farther south, the species has been recorded from Mexico City". *Smerinthus astarte* was subsequently reinstated as a species by Eitschberger (2002: 89) without any justification: "Although there is no material available to me from CO, I am convinced from previous research that this taxon will last, as species or subspecies". He also questioned whether the populations in AZ and Mexico were conspecific. Tuttle (2007: 117) followed Hodges (1971), treating *S. astarte* as a junior synonym of *S. cerisyi*, and retained *S. saliceti* for the AZ populations. Schmidt & Anweiler (in Pohl et al. 2010: 503), when reinstating *S. ophthalmica* as a species, noted that "It is indeed possible that the prairie taxon is a species separate from both the southern mountain and boreal populations, related to or conspecific with *saliceti*. Antennal structure, wing phenotype, and mitochondrial DNA indicate a closer relationship of these southern AB populations to *saliceti* than to *cerisyi*". Indeed, analysis of DNA sequence data does suggest that the prairie populations from southern AB south through the USA and western Mexico as far as Guadalajara are a species separate from *S. cerisyi* and *S. ophthalmica*, but they also indicate that the populations of central and southern Mexico represent a fourth species. The unresolved issue is, however, to which of the two species that occur in Mexico does the name *S. saliceti* apply? In the original description, Boisduval ([1875]) gave the type locality only as "Mexique". It is perhaps more probable that, at that time, Boisduval's specimens would have come from central rather than north/west Mexico, and thus, these are the populations to which the name *S. saliceti* would more appropriately apply. The next oldest name for the other species is then *S. astarte*, which was reinstated by Kitching & Rougerie et al. (2018) and maintained as valid in the present checklist for the aforementioned central NA populations. Hence; *S. saliceti* is deemed excluded from the NA fauna in the present checklist. However, the matter will only be finally resolved when the lectotype of *S. saliceti* is designated and its DNA sequenced.

3e. 890144.1 Paonias macrops (Gehlen, 1933)

Paonias macrops was reinstated as a species by Eitschberger (2002: 87) with only a minimal explanatory justification: “On the basis of the phenotype as well as differences in the genital structures, a good species (see Plate 16)”. However, the male genitalia of Smerinthinae are quite individually variable and examination of the illustrated genitalia show no clear and consistent differences from those of *P. myops*. Nevertheless, the distribution of *P. macrops*, as then understood, was quite disjunct from that of *P. myops*; the former taxon being apparently restricted to central Mexico and the latter occurring in the USA and Canada. On this basis, *P. macrops* was re-synonymized with *P. myops*, but retained as a subspecies, by Kitching & Rougerie et al. (2018). Recent analysis of DNA barcode data now indicate that *P. macrops* is 3 to 4% divergent from *P. myops*, which in non-feeding Smerinthinae is just sufficient to indicate a species-level separation (Rezác 2018). Consequently, *P. macrops* is here reinstated to species status (rev. stat.). However, it should be noted that all samples of *P. myops* and *P. macrops* currently constitute a single BIN (AAA6112) and so further sampling in northern Mexico may yet demonstrate that the two taxa are conspecific.

Hodges (1971: 86) noted “a rather striking form [of *Paonias myops*] occurs in southern Arizona in which the markings of the forewings are suffused so that no elements of the pattern appear distinct, and the middle portion of the thorax has a well-defined gold-yellow band”. This form was subsequently described by Eitschberger (2002) as *P. emmeli* and distinguished from more northern and eastern populations of *P. myops* using both the color pattern and features of the male genitalia. The latter all fall within the range of individual variation of a smerinthine species and cannot be used to support species status, but the color pattern characters are consistent. However, these same features also serve to distinguish *P. macrops* from *P. myops* and analysis of DNA barcode data confirms the close relationship between the Mexican and southern AZ populations, with less than 1% divergence between samples from Michoacán and AZ. Furthermore, populations of *P. macrops* are now known from intermediate localities in the northern Mexican states of Sonora and Chihuahua, so partially closing the geographical gap. Tuttle (2007: 121) had synonymized *emmeli* with *P. myops* (but without giving any explanation). Kitching & Rougerie et al. (2018) treated *emmeli* as a synonym of subspecies *P. myops macrops*, but based on the reassessed habitus characters and DNA barcode analysis above, we here treat *P. macrops* as a full species and transfer the synonymy of *emmeli* to *P. macrops* (rev. syn.).

Comparison of current P-Numbers to the original 2016 P-Numbers

In general, species added since the numbering scheme of Pohl et al. (2016) are inserted in proper position in the P-Number sequence with a decimal number, and species moved to a new position within the superfamily since then are also given new decimal numbers. However, in some superfamiles the number of changes was so great that a complete renumbering was required. Significant changes to superfamily numbering schemes since Pohl et al. (2016) are as follows:

01. MICROPTERIGOIDEA
No change.

07. ERIOCRANIOIDEA
No change.

09a. NEOPSEUSTOIDEA
Moved superfamily from no. 13, but four-digit species numbers remain unchanged.

11. HEPIALOIDEA
No change.

16a. NEPTICULOIDEA
New numbering scheme following van Nieukerken et al. (2016). The current scheme was adopted previously in the Canada–AK checklist of Pohl et al. (2018).

21a. ADELOIDEA
New numbering scheme following the taxonomic sequence presented herein.

23a. TISCHERIOIDEA
New numbering scheme following the taxonomic sequence presented herein.

30. TINEOIDEA
No change. Note that the genus *Acrolophus* has been returned to alphabetic order, resulting in a number of decimals due to species moves.

33a. GRACILLARIOIDEA
New numbering scheme following the taxonomic sequence presented herein. Note that within Bucculatricidae, the species numbers remain the same.

36a. YPONOMEUTOIDEA
New numbering scheme following the taxonomic sequence presented herein.

37a. DITRYSIA – SUPERFAMILY UNASSIGNED
Moved superfamily from no. 58, but the sole four-digit species number is retained unchanged.

38a. APODITRYSIA – SUPERFAMILY UNASSIGNED
New numbering scheme following the taxonomic sequence presented herein.

40a. DOUGLASIOIDEA
Recognized as a distinct superfamily rather than being placed as “unassigned Apoditrysia” under superfamily no. 38. The current scheme was adopted previously in the Canada–AK checklist of Pohl et al. (2018).

43a. SCHRECKENSTEINIOIDEA
Moved superfamily from no. 50, but four-digit species numbers remain unchanged.

45a. URODOIDEA
Moved superfamily from no. 54, but four-digit species numbers remain unchanged.

47a. CHOREUTOIDEA
Moved superfamily from no. 58. New numbering scheme following the taxonomic sequence presented herein.

49a. GALACTICOIDEA
Moved superfamily from no. 60, but the sole four-digit species number remains unchanged.

51a. TORTRICOIDEA
Moved superfamily from no. 62. The four-digit species numbers remain unchanged, except for subtribe Cochylina and genus *Pelochrista*, where the order had changed so much that they required renumbering. New numbers, ending with ".1" to avoid confusion with the old numbers, were assigned to those groups. A significant number of decimal numbers were also necessary in the genera *Eucopina*, *Epiblema* and *Dichrorampha*, to accommodate new species orders.

53a. COSSOIDEA
This superfamily has recently been recognized as distinct from Sesioidea. Species are moved from superfamily no. 64, but the four-digit species numbers remain unchanged.

55a. SESIOIDEA
Moved superfamily from no. 64. The four-digit species numbers remain unchanged, so they begin at 55a0048, after the removal of the Cossoidea.

57a. ZYGAENOIDEA
Moved superfamily from no. 66. New numbering scheme following the taxonomic sequence presented herein.

59a. GELECHIOIDEA
Moved superfamily from no. 42, but four-digit species numbers remain unchanged, with the exception of Coleophoridae. The sole coleophorid genus *Coleophora* has been arranged alphabetically and has been renumbered with decimal numbers.

61a. ALUCITOIDEA
Moved superfamily from no. 44, but four-digit species numbers remain unchanged.

63a. PTEROPHOROIDEA
Moved superfamily from no. 46, but four-digit species numbers remain unchanged.

65a. CARPOSINOIDEA
Moved superfamily from no.48, but four-digit species numbers remain unchanged.

67a. EPERMENIOIDEA
Moved superfamily from no. 52, but four-digit species numbers remain unchanged.

70. THYRIDOIDEA
No change.

72. HYBLAEOIDEA
No change.

77a. PAPILIONOIDEA
New numbering scheme following the taxonomic sequence presented herein.

80a. PYRALOIDEA
New numbering scheme following the taxonomic sequence presented herein. Note that two *Argyria* species were added as decimals very late in the preparation of this work.

83. MIMALLONOIDEA
No change.

85. DREPANOIDEA
No change.

87. LASIOCAMPOIDEA
No change.

89. BOMBYCOIDEA
No change.

91a. GEOMETROIDEA
New numbering scheme following the taxonomic sequence presented herein, but the species numbers for Uraniidae and Sematuridae have been preserved at the beginning of the superfamily. Note that two *Homochlodes* species were synonymized very late in the preparation of this work, resulting in the numbers 91a1141 and 91a1142 not being used.

93. NOCTUOIDEA
Original P-Numbers from Lafontaine & Schmidt (2010) have been retained, with additions and modifications in the Noctuoidea checklist updates by Lafontaine & Schmidt (2011, 2013a, 2015) and Schmidt et al. (2018), and more recent additions and rearrangements. Thus, any numbers with decimals indicate species that have been moved or added since the original numbers were assigned in 2010. Note that in a few cases, the decimals employed here differ slightly from decimal numbers used in published updates to Lafontaine & Schmidt (2010), as follows:

Current No.	Name author, date (original genus)	Old No.
930356.5	Xenosoma flaviceps (Walker, 1865) (Eloria)	930356.1
930447.5	Aclytia heber (Cramer, [1780]) (Sphinx)	930447.1
930468.5	Nyridela xanthocera (Walker, 1856) (Gymnelia)	930468.1
930541.5	Thursania lycimnia (Druce, 1891) (Theotinus)	930541.1
930611.5	Dinumma deponens Walker, 1858 (Dinumma)	930611.1
930621.5	Gonodontodes dispar Hampson, 1913 (Gonodontodes)	930621.1
930968.5	Ophisma tropicalis Guenée, 1852 (Ophisma)	930968.1
930968.6	Mimophisma forbesi Schaus, 1940 (Mimophisma)	930968.1
930968.65	Mimophisma delunaris (Guenée, 1852) (Ophisma)	930968.2
930968.7	Achaea ablunaris (Guenée, 1852) (Ophisma)	930968.3
931160.5	Litoprospus futilis (Grote & Robinson, 1868) (Dyops)	931160.1
931160.6	Litoprospus hatuey (Poey, 1832) (Noctua)	931160.2
931160.7	Litoprospus bahamensis Hampson, 1926 (Litoprosopus)	931160.3
931160.8	Litoprospus coachella Hill, 1921 (Litoprosopus)	931160.4
931160.9	Litoprospus confligens (Walker, [1858]) (Dyops)	931160.5
931253.5	Concana mundissima Walker, [1858] (Concana)	931253.2
931427.4	Acronicta mansueta (Smith, 1897) (Acronycta)	931434.2
931427.5	Acronicta parallela (Grote, 1879) (Apatela)	931434.1
931432.1	Acronicta fallax (Herrich-Schäffer, 1854) (Diphthera)	931442.1
931732.72	Cydosia majuscula (Edwards, 1881) (Penthetria)	931254.1
931970.2	Neotuerta collectiora (Todd, 1966) (Tuerta)	931970.1
932034.75	Aleptina arenaria Metzler & Forbes, 2011 (Aleptina)	931636.1
932076.1	Schinia amblys (Dyar, 1913) (Lygranthoecia)	932130.1
932249.11	Chytonix palliatricula (Guenée, 1852) (Bryophila)	932249.5
932249.12	Chytonix sensilis Grote, 1881 (Chytonix)	932249.51
932361.5	Cherokeea attakullakulla Sullivan & Quinter, 2014 (Cherokeea)	932361.1
932615.2	Agrochola lunosa (Haworth, 1809) (Noctua)	932615.1
932648.5	Paraseptis adnixa (Grote, 1880) (Hadena)	932648.1
933115.7	Rhabdorthodes pattersoni Crabo, 2018 (Rhabdorthodes)	933115.1

International Commission on Zoological Nomenclature (ICZN). 1954a. Opinion 278. Addition to the 'Official list of generic names in Zoology' of the names of ten genera of the sub-order Rhopalocera of the order Lepidoptera (class Insecta), species of which were cited in the undated leaflet commonly known as the 'Tentamen', prepared by Jacob Hübner, which is believed to have been distributed to correspondents in 1806, a leaflet rejected in 'Opinion 97'. Opinions and Declarations rendered by the International Commission on Zoological Nomenclature 6(I): 135-178.
International Commission on Zoological Nomenclature (ICZN). 1954b. Opinion 286. Suppression, under plenary powers, of the specific name *ajax* Linnaeus, 1758, as published in the combination *Papilio ajax* (Class Insecta, Order Lepidoptera). Opinions and Declarations Rendered by the International Commission on Zoological Nomenclature 8: 29-48.
International Commission on Zoological Nomenclature (ICZN). 1957. Opinion 450. Suppression under the plenary powers of the generic name "*Phalaena*" Linnaeus, 1758, and validation as of subgeneric status (a) as from 1758, of the terms "*Bombyx*", "*Noctua*", "*Geometra*", "*Tortrix*", "*Pyralis*", "*Tinea*" and "*Alucita*", as used by Linnaeus for groups of species of the genus "*Phalaena*" and (b) as from 1767 of the term "*Attacus*" similarly published by Linnaeus and matters incidental thereto (Class Insecta, Order Lepidoptera). Opinions and Declarations Rendered by the International Commission on Zoological Nomenclature 15(15): 251-328.

INDEX

All Lepidoptera taxa up to the family level that appear in the body of the list (including notes) are included here. Names mentioned in Appendix I are also included as it is simply a collection of a few more lengthy notes. Plant names are not indexed. **Numbers in the index are P-Numbers rather than page numbers. Appendix I entries are listed by appendix section number, preceded by "App.".** Valid names are in plain text; synonyms are in italics. Extralimital names that do not have a line entry in the list, but that are mentioned in a note or family text, are also in italics. For taxa above the species level, the number indicates the P-Number of the first valid species name in the group. For synonyms of species and subspecies, the number listed is the P-Number of the valid "parent" species or subspecies. Where multiple P-Numbers are listed for a name, the additional numbers in italics indicate other taxon entries where the name in question is mentioned in the notes. Names below family level but above the species level are followed by the author and then the family in square brackets. Species-level names are followed by the author and then the current genus in round brackets. A few abbreviations are used for lengthy author names; all full author names can be found in the body of the list.
